**Chlamydia/Neisseria gonorrhoeae End-Point PCR Kit**  
**Product Insert**

**Product#** EP42500

**Intended Use**
Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR Kit is designed for the detection of Chlamydia/Neisseria specific DNA based on the use of end-point PCR technology. This kit is designed for research use only and not for use in diagnostic procedures.

**Background Information**
*Chlamydia trachomatis* is the causative agent of *Chlamydia*, a Gram-negative bacteria. Transmission of the bacteria occurs via contact with infected bodily fluids which then infect mucosal membranes. It can be transmitted from mother to child during pregnancy and infect the eyes causing conjunctivitis. The genital infection causes urethritis, epididymitis and prostatitis in males and Pelvic Inflammatory Disease (PID) in females with an increased risk of contracting HIV. The infection can be treated with a course of antibiotics. Sexually transmitted infections in females are most often asymptomatic, but can be noticeable in chronic pain of the pelvic region, vaginal bleeding and painful urination. Infection of the ovaries, fallopian tubes or uterus causes Pelvic Inflammatory Disease (PID) which can lead to difficulties in conceiving, increased risk of ectopic pregnancy or infertility. Infections in males are more likely to be symptomatic, causing painful urination, discharge from the penis and swollen testicles and may eventually cause infertility if left untreated.

*Neisseria gonorrhoeae* is a Gram-negative coccus of the Neisseria genus. *N. gonorrhoeae* is usually seen in pairs infecting human cells. It has a circular DNA genome of approximately 1Mbp encoding over 2000 genes. *N. gonorrhoeae* is transmitted by sexual contact and usually causes infection in cells of the mucous membrane of the male urethra or the endocervix and urethra in females. During infection, polysaccharides are released from the bacteria that stimulate host cell production of tumour necrosis factors that cause an inflammatory response. There is no vaccine against *N. gonorrhoeae* infection and antibiotic resistance is beginning to increase, therefore treatment includes a course of antibiotics that will be effective against resistant strains. Complications in males caused by the infection can result in prostatitis or orchitis if the bacteria spread. In females, invasion of the fallopian tubes or ovaries can result in salpingitis or ovaritis respectively, with any of these infections possibly resulting in sterility.

**Product Description**
Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR Kit is designed for the detection of Chlamydia and *Neisseria gonorrhoeae* specific DNA based on the use of end-point PCR technology. This kit is designed for research use only and not for use in diagnostic procedures. The kit includes Master Mix and primers for the specific amplification of a 260 bp region of the Chlamydia genome and a 360 bp region of the Neisseria genome, as well as a positive control and a negative control to confirm the integrity of the kit reagents. In addition, the kit contains loading dye and a DNA ladder to facilitate analysis of the results.

The detection of *Chlamydia* and *Neisseria gonorrhoeae* specific DNA is based on end-point PCR technology, utilizing polymerase chain reaction (PCR) for the amplification of specific Chlamydia/Neisseria DNA sequences. For analysis of the PCR data, the PCR reaction is loaded on an agarose DNA gel along with the provided DNA ladder for qualitative analysis.

Norgen’s Chlamydia/Neisseria gonorrhoeae End-Point PCR Kit was developed and validated to be used with the following PCR instruments:
- Qiagen Rotor-Gene Q
- BioRad CFX96 Touch™ Real-Time PCR Detection System

Storage Conditions and Product Stability

- All kit components should be stored at -20°C upon arrival
- Repeated thawing and freezing (> 2 x) of the Master Mix and Positive Control should be avoided, as this may affect the performance of the assay. If the reagents are to be used only intermittently, they should be frozen in aliquots.
- All reagents can be stored for 1 year at -20°C without showing any reduction in performance.

Customer-Supplied Reagents and Equipment

- Appropriate End-point PCR Instrument
- DNA Purification Kit
  - The kit is compatible with all DNA purification kits that yield high quality, inhibitor-free DNA
  - Recommended Purification Kit: Norgen's Urine DNA Isolation Kit (Slurry Format) (Cat. 48800, 27100)
- Disposable powder-free gloves
- Benchtop microcentrifuge
- Micropipettors
- Sterile pipette tips with filters
- PCR tubes
- Vortex mixer
- Agarose gel electrophoresis apparatus
- UV transilluminator with suitable gel documentation system
- PCR reaction preparation station (Optional)

Quality Control

In accordance with Norgen’s ISO 9001 and ISO 13485-certified Quality Management System, each lot of Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR Kit is tested against predetermined specifications to ensure consistent product quality.

Warnings and Precautions

- Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR Kit is intended for research purposes only. It is not intended for diagnostic use.
- Follow universal precautions. All specimens should be considered as potentially infectious and handled accordingly.
- Ensure that a suitable lab coat, disposable gloves and protective goggles are worn when handling specimens and kit reagents.
- Use sterile pipette tips with filters. Use proper pipetting techniques and maintain the same pipetting pattern throughout the procedure to ensure optimal and reproducible values.
As contamination of specimens or reagents can produce erroneous results, it is essential
to use aseptic techniques. Pipette and handle reagents carefully to avoid mixing of the
samples.

Do not use supplies and equipment across the dedicated areas of i) specimen extraction,
ii) reaction set-up and iii) amplification/detection. No cross-movement should be allowed
between the different areas. Personal protective equipment, such as laboratory coats and
disposable gloves, should be area specific.

Store and extract positive material (specimens, controls and amplicons) separately from
all other reagents and add it to the reaction mix in a spatially separated facility.

Dispose of unused kit reagents and specimens according to local, provincial or federal
regulations.

Do not substitute or mix reagents from different kit lots or from other manufacturers. Do
not use components of the kit that have been stored for more than 1 year.

The presence of PCR inhibitors may cause false negative or invalid results.

Potential mutations within the target regions of the *Chlamydia/Neisseria* genome covered
by the primers in this kit may result in failure to detect the presence of the pathogen.

Good laboratory practice is essential for the proper performance of this kit. Ensure that
the purity of the kit and reactions is maintained at all times, and closely monitor all
reagents for contamination. Do not use any reagents that appear to be contaminated.

Ensure that appropriate specimen collection, transport, storage and processing
techniques are followed for optimal performance of this test.

Instructions for Use

A. Sample Preparation

Purified DNA is the starting material for Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point
PCR Kit. The quality of the DNA template will have a major impact on the performance of the
*Chlamydia/Neisseria* detection test. The user must ensure that the method used for DNA
purification is compatible with end-point PCR. We recommend the use of Norgen’s Urine DNA
Isolation Kit (Slurry Format) (Cat. 48800, 27100). Norgen’s Urine DNA Isolation Kit (Slurry
Format) has been fully validated with Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR
Kit.

If using a different spin column based sample preparation procedure that includes ethanol-based
wash buffers is used, a column drying step consisting of centrifugation for 3 minutes at 20,000 x g
(~14,000 RPM), using a new collection tube, is highly recommended prior to the elution of the
DNA. This will help to prevent the carry-over of any ethanol into the purified DNA, as ethanol is
known to be a strong inhibitor of PCR. Ensure that any traces of ethanol from the sample
preparation steps are eliminated prior to the elution of the DNA.

B. PCR Assay Preparation

Notes:
- Before use, suitable amounts of all PCR components should be completely thawed at room
temperature, mixed by gentle vortexing or by pipetting, and centrifuged briefly.
- Work quickly on ice.
- The amount of MDX 2X PCR Master Mix provided is enough for up to 32 PCR reactions (24
  sample PCR, 4 positive control PCR and 4 no template control PCR).
For every PCR run, one reaction containing Chlamydia/Neisseria Positive Control and one reaction as no template control must be included for proper interpretation of results.

The recommended minimum number of DNA samples tested per PCR run is 6.

To avoid any contamination while preparing the PCR assay, follow the order outlined in Tables 1, 2 and 3 below to prepare the Negative Control, Detection Assay and Positive Control:

1. Prepare the PCR Negative Control (Table 1)
2. Prepare the PCR Chlamydia/Neisseria Assay (Table 2)
3. Prepare the PCR Positive Control (Table 3)

To further avoid contamination, add the components to the PCR tubes in the order shown in the tables below (ie: 1) Nuclease-free water; 2) Master Mix; 3) Primer Mix; and 4) the Sample DNA or Positive Control).

1. For each PCR set, prepare one no template control PCR as shown in Table 1 below:

<table>
<thead>
<tr>
<th>Table 1. PCR Negative Control Preparation</th>
</tr>
</thead>
<tbody>
<tr>
<td>PCR Components</td>
</tr>
<tr>
<td>------------------------------------------</td>
</tr>
<tr>

</tr>
<tr>
<td>MDx 2X PCR Master Mix</td>
</tr>
<tr>
<td>Chlamydia/Neisseria Primer Mix</td>
</tr>
<tr>
<td>Total Volume</td>
</tr>
</tbody>
</table>

2. Prepare the PCR reaction for sample detection as shown in Table 2 below. The recommended amount of sample DNA to be used is 2.5 μL. However, a volume between 1 and 5 μL of sample DNA may be used as template. Adjust the final volume of the PCR reaction to 20 μL using the Nuclease-Free Water provided.

C. Chlamydia/Neisseria PCR Assay Programming

1. Program the thermocycler according to the program shown in Table 4 below.
2. Run one step PCR.

D. Chlamydia/Neisseria PCR Assay Interpretation

- For the analysis of the PCR data, the entire 20 µL PCR reaction should be loaded on a 1X TAE 1.4 % Agarose DNA gel along with 10 µL of Norgen’s DNA Ladder (provided).
- The PCR products should be resolved on the 1X TAE, 1.4 % Agarose gel at 150V for 30 minutes (Gel running time will vary depending on an electrophoresis apparatus).

For results obtained that are not covered in Table 5 above, please refer to the Frequently Asked Questions.
Figure 1: A representative 1X TAE, 1.4 % agarose gel showing the amplification of *Chlamydia/Neisseria* at different concentrations. The size of the *Chlamydia/Neisseria* target amplicon corresponds to the 260 and 360 bp bands represented by the provided DNA Marker (M).

E. *Chlamydia/Neisseria* PCR Assay Specificity

The specificity of Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR Kit is first and foremost ensured by the selection of the *Chlamydia/Neisseria*-specific primers, as well as the selection of stringent reaction conditions. The *Chlamydia/Neisseria* primers were checked for possible homologies to all human related viruses in GenBank published sequences by sequence comparison analysis.

Frequently Asked Questions

1. How many samples should be included per PCR run?
   - Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR Kit is designed to test 24 samples. For every 6 samples, a non-template control (Nuclease Free Water) and a Positive Control must be included. It is preferable to collect and test 6 samples at a time.

2. How should it be interpreted if in negative control the *Chlamydia/Neisseria* PCR control and the *Chlamydia/Neisseria* target showed amplification in a sample?
   - The assay has to be repeated. It could happen when there is carryover contamination.

3. How should it be interpreted if only the *Chlamydia/Neisseria* target was amplified in a sample?
   - The sample tested should be considered as *Chlamydia/Neisseria* positive. At high *Chlamydia/Neisseria* input, the *Chlamydia/Neisseria* amplicon will be predominant and thus the *Chlamydia/Neisseria* PCR control may not amplify as they compete for PCR resources.

Technical Support

Contact our Technical Support Team between the hours of 8:30 and 5:30 (Eastern Standard Time) at (905) 227-8848 or Toll Free at 1-866-667-4362.

Product Use Restriction
Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR Kit is designed for the detection of *Chlamydia/Neisseria* specific DNA based on the use of end-point PCR technology. This kit is designed for research use only and not for use in diagnostic procedures.

Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR Kit is intended for use by professional users such as technicians and biologists experienced and trained in molecular biological techniques including PCR.

Good laboratory practice is essential for the proper performance of this kit. Ensure that the purity of the kit and reactions is maintained at all times, and closely monitor all reagents for contamination. Do not use any reagents that appear to be contaminated.

Ensure that appropriate specimen collection, transport, storage and processing techniques are followed for optimal performance of this test.

The presence of PCR inhibitors may cause false negative or invalid results.

Potential mutations within the target regions of the *Chlamydia/Neisseria* genome covered by the primers in this kit may result in failure to detect the presence of the pathogen.

The respective user is liable for any and all damages resulting from application of Norgen’s *Chlamydia/Neisseria gonorrhoeae* End-Point PCR Kit for use deviating from the intended use as specified in the user manual.

All products sold by Norgen Biotek are subjected to extensive quality control procedures and are warranted to perform as described when used correctly. Any problems should be reported immediately. The kit contents are for laboratory use only, and they must be stored in the laboratory and must not be used for purposes other than intended. The kit contents are unfit for consumption.
